

Gas Contracts

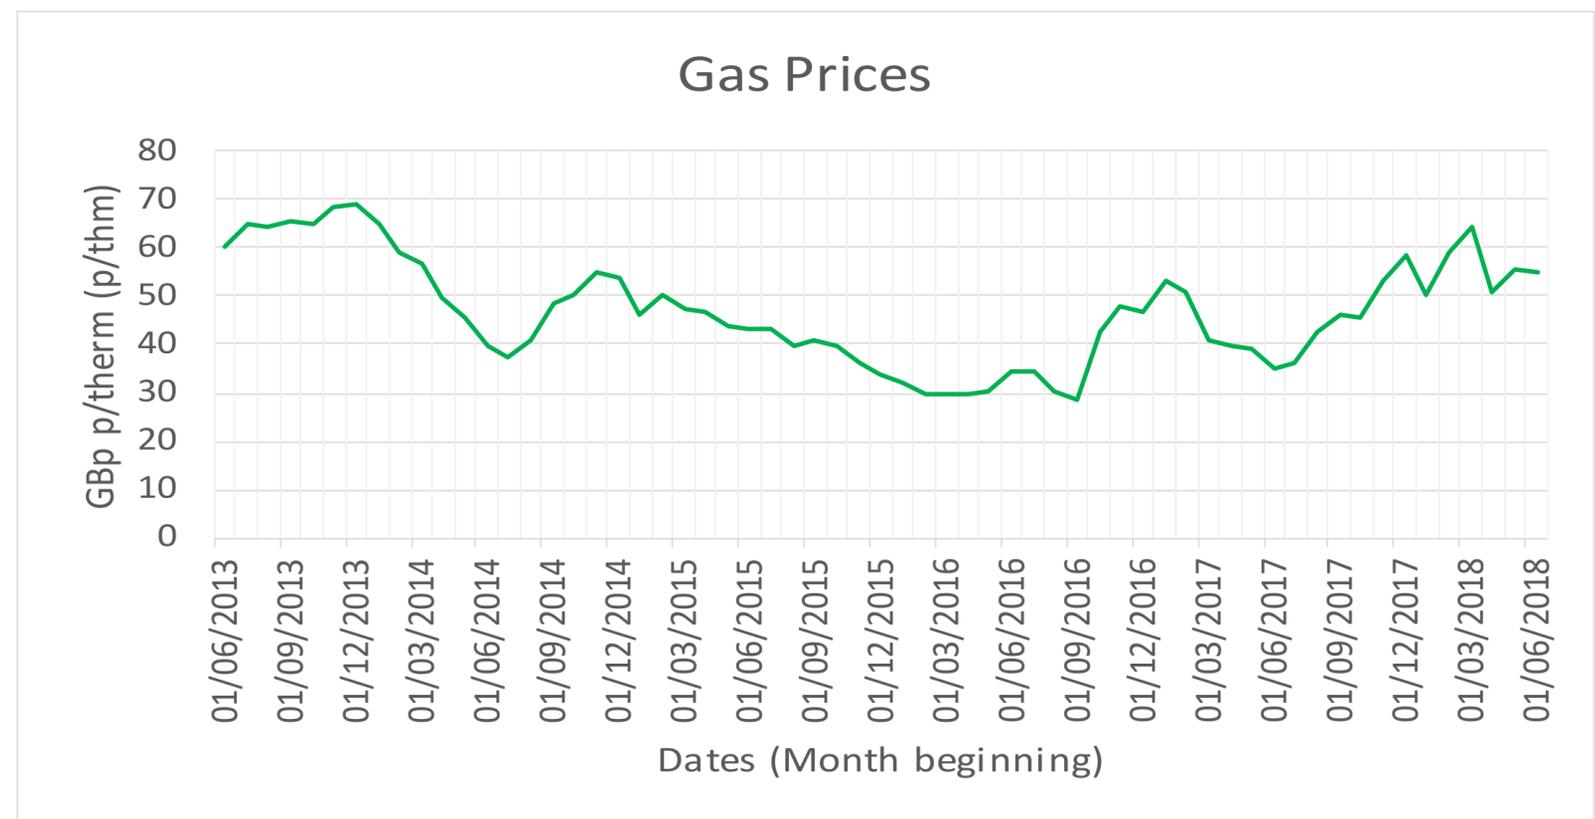

Since 2013, retail gas prices haven't come out of the 25-75 p/therm range. However, since 2015 gas prices have been rising, indicating that it is likely that we will see prices top 75 p/therm. We have already seen oil per barrel hit the highest price in the last four years, suggesting that we will see an increase in gas prices soon. To avoid fluctuations in the market, secure deals soon, if your contract is coming close to an end then sort your renewal.

Getting the gas contract you need...

With the possibility of seeing gas prices higher than ever in the next few years, and imminent factors such as Brexit, crippling weather conditions and US oil price rises, we cannot foresee the prices going down. Securing contracts sooner can save you from these impending price rises.

Therm

A unit of measurement used by the UK wholesale gas market. It is a unit of the heat energy content from volume, rather than cubic measurements which are just volume itself.

Comparative Companies

Getting offers from comparative companies cut a lot of the work out for you. Choosing an established, trusted company such as Utility Bidder will give you offers across the breadth of the market. We aim to make the rest of proceedings easier for you. All you're left to do is choose.

Securing Longterm

Securing a contract between 3-5 years can save you from price changes between your start and end dates, the longer your contract the longer you will be protected.
